Name of coodinator:			Per Ole Frederiksen				Year, quarter:				4. quarter 2018		
Community:			Attu.				Trend*				Comments regarding number, size of hunted animals, first/last observed, etc.	Significans and possible explanation of trend*	Management recommendation (elaborate eventually on separate sheet)
Species/ impact	Month	Locality	Total number of trips	Number seen	Caught in all	Method	Unchanged	More	Less	Dont know			
Atlantic Cod	10	Attu	85		131 tons	Net	X				Less Cod. Size unchanged. This year the cod disappeared earlier than last year.	The sea temperature may have decreased as well as the sea salt content changed. Cod's favorite food has disappeared and this year there are plenty of seals.	The recommendation is to carefully monitor the cod stock as well as the condition of the sea. Plans for reducing the seal population are needed
	11	Attu	67		3,6 tons	Net			X				
	12	Attu	53		0				X				
Seal	10	Attu	85	10000				X			Increasing numbers. The presence of seals this year is noticeable. Especially ringed seal. Although the seal is quite fat this year, some are still sinking.		
	11	Attu	67	10000				X					
	12	Attu	53	Thousands				X					Plans for reducing the population are needed to keep the ecosystem in the wished balance.
Climate and weat	10	Attu	85								The dry wind from the north and the west wind are missing this year. The last few years we have been missing these winds.	This year there were no icebergs west for Attu. The large icebergs were missing. The cold summer was also felt in Attu. That's probably why the fall came late.	
	11	Attu	67										
	12	Attu	53										
Thick-billed Murre	10	Attu	85				X				There were few, and only few were caught. The birds seemed to be in fat condition.	It is believed that due to the lack of western ice, we are missing Murres. The winter ice arrived in Attu quite late. Therefore, it is difficult to assess the Murre population status	
	11	Attu	67	10				X					
	12	Attu	53	20				X					Recommendations concerning Murre should be dealt with in the Municipality of Qeqertalik.
